## Cracked Mapas Windows Download X32

My code to load the image is: `ncc2 = ncc_gen(W,H,img,true)` `W = ncc2.W` `H = ncc2.H` `plot(ncc2)` my question is how to load the image from the filenames and how to save the images? A: You can use fileparts to get the file part of a path Here's an example: `## Get the first and the last '.' characters from a path first_dot = fileparts(img).strcmp('/.');` `last_dot = fileparts(img).strcmp('/..');` `## Test it fprintf(' First dot: %d Last dot: %d ',first_dot,last_dot);` `## Get all the characters curr_char = cellstr(fileparts(img));` `## Break the path all_char = [curr_char(1:end-2) curr_char(end-1:1)];` `## Change the '.' and '..' all_char = [all_char(first_dot:last_dot+1) '.'];` `## Here is the code that loads the image N = length(all_char);` `NCC_img = cell(N,1);` `for i = 1:N fprintf(' Loading: %s ',all_char(i));` `NCC_img{i} = imread(all_char(i));` `end` This will give you images named like: `somedata.ncc_img.1` `somedata.ncc_img.2` etc. As I said, this is more useful if you have many files, otherwise it's not much faster than loading each one individually. Q: jQuery addClass not working on dynamic elements I have a dynamically added element: ... The element is added on a click to a table like this: `var new_element = $("New Element`
