The major objective of the invention is to provide a device and method for accurately monitoring the wear of component parts during a manufacturing process. It is a further objective of the invention to provide a method of manufacturing parts, where a part is secured to a base and removed after a predetermined amount of wear has occurred. It is a further objective of the invention to provide a method of manufacturing parts, where the wear of component parts may be monitored as the parts are being manufactured and repaired. It is a further objective of the invention to provide a method of manufacturing parts where a part may be assembled and then monitored for its wear during assembly. It is a further objective of the invention to provide a method of manufacturing parts where a part may be easily removed from the parts manufacturing machine and subsequently be replaced in order to monitor the wear of the part. The device and method of the invention combine a wear indicator with a manufacturing process. The wear indicator is an assembly that is secured to one or more component parts of the manufacturing process. The wear indicator assembly consists of a number of magnetically activatable wear indicators. Each wear indicator has a base with a magnetically activatable member attached to the base. A spring is positioned between the magnetically activatable member and the base such that a force is applied to the magnetically activatable member when the spring is compressed. The magnetically activatable member is positioned adjacent a component part of the manufacturing process such that as the component part contacts the wear indicator the spring is compressed. As the spring is compressed a magnetic switch is activated. When the switch is activated it provides an electrical signal indicating that the component part has contacted the wear indicator and that the component part has worn a pre-determined amount. According to a further aspect of the invention, the manufacture of the component part and/or the wear indicator assembly may be monitored for a pre-determined amount
