Console Backup and Restore is a little  
tool designed to backup and restore  
your entire FFXI client's data to a

---

USB drive. It uses the USB hub present on most computers and therefore the program can be used on any computer. This utility is run either after or during client updates, and the backup is made only when changes have been detected. Using the Backup Screen, you can quickly restore your entire client to its previous state at the press of a button.

The program works with both the normal client and client patching, and even detects modifications to the standard configuration files as well as game files which have changed. The backup file is saved in a.ZIP format.

---

Tools: FFXI Console Backup and Restore is just a utility to backup and restore the data. So it will not come with any tools. First of all, you will have to install the program on a USB drive you want to use. There is no need to extract

With the economy in the gutter, I'm looking for something that'll hold my cash. While I may have been able to bring myself to the check-out counter and make an unreasonable request, I thought I'd share some pics of the ones I've been seeing everywhere. If you've got a spare moment, take a look at them. Even worn, with a little elbow grease, any of these wallets

#### What's New In FFXI Switch Monitor?

Keyboard bindings are two items of information that the system and the player use to determine the game input to use. The Controller Information, such as the assigned controller number, and the Controller Acceleration, such as the controller wheel delta. Keyboard bindings are an A.I. program that creates a mapping between a game input, such as a controller button press, and a keyboard command, such as a

---

keyboard button press. At the most basic level, a keyboard binding is a byte-to-byte mapping of game input to the keyboard input. Inputs that are mapped to keyboard inputs are usually mapped to keys that are close to the player. When the player is on the keyboard, the player inputs are less likely to be treated as non-inputs (left bumper or right bumper buttons on the D-pad) and instead are likely to be mouse inputs, which are more likely to be considered as input events. However, there are also keyboard commands (such as `HID_Y`) that are not normally treated

---

as input events, and can be problematic to bind to certain keyboard commands. Player controllers are designed to easily be remapped from player to player, and so, keyboard bindings are generally remapped between players. The default order of inputs for controllers is backwards in the game. Ctrl P1 (default, P1) → Ctrl P2 (on a gamepad) → Ctrl P3 (alternate keybind) → Ctrl P1 (P1) Ctrl P2 → Ctrl P3 (on a gamepad) → Ctrl P1 (alternate keybind) → Ctrl P2 (P2) Ctrl P3 → Ctrl P1 (on a gamepad) → Ctrl P2 (alternate keybind) → Ctrl P3

---

(P3) When a game uses HID key bindings, the key binding will specify a `HID_XXX` command to use, in addition to whatever keys the keyboard command map (key-to-command) specifies. Some keyboard commands can modify the input state of the game. Examples of keyboard commands include editing the rotation state of the gamepad, or changing the player's invisibility state. The following shows an example of where the player might normally input a Left bumper press, and where they might normally input a Left bumper press on controller input.
