I've found a number of sites out there that will allow you to post your comments without logging in. Does this exist on stack overflow? A: No, there is no "easy way". You are logged in. You can easily turn off cookies if you wish, but the chances are your browser's preferences are set to not allow them. It's possible to use a third party app to log into other accounts, but you'd have to get access to the raw data. I'm sure the Stack Exchange team has access to this in some way, they'll probably want you to use their site for this. Abstract A prominent theoretical model of fission-fusion dynamics is the symmetric-gravitational model (SGM) of the interactions of loosely-bound nucleons. In this model, the fission products are taken to have a macroscopic spatial distribution function which reflects the position dependence of a clusterization interaction. The SGM is used to describe the fission/fusion of several nuclei (under the assumption of phase space distribution invariance) and has been shown to be a very good representation of some measured fission/fusion cross sections. Calculations have shown that the SGM can also represent reactions such as the n+n system fusion to give the high-spin fission of the compound nucleus [nuc-mass] with the same quality. However, the experimentally observed maximum spin values for this type of fission have not been reproduced by the SGM in the cases of [nuc-mass] = 58, 56, and 59. Here, we extend the SGM model to include the interaction of nucleons within loosely-bound clusters (originating from the different shells of the initial compound nucleus), for the first time. It is found that the inclusion of the clusterization interaction permits the maximum spin of the fission products of all reactions studied to be predicted and that the cross sections for [nuc-mass] = 58 and 59 can be reproduced with the SGM.The present invention relates to a mount for connecting a plastic cap 77a5ca646e
