

Modern Audio Tagger Cracked Accounts is a very simple and straightforward music tag editor. A very simple interface and the fact that it does what it says on the tin make this app very flexible. Its tag editor is good, but it really needs to be more robust, it doesn't have nearly as much functionality as it should. It would be nice if it could scan and replace tags when necessary. For example, if the title of a song has a space in it it won't be changed. It doesn't recognize that "American Pie" is actually 2 songs: "American Pie" & "American Pie (song)". It only shows the first song as if it's a single song.

Q: Formatting string.format in C# I'm having trouble with formatting my strings when using string.format. I want to do something like the following: string format = @"{0} ({1} seconds)", sizefile, (elapsed) The problem is I don't want to specify the brackets like so: string format = string.Format("{0} ({1} seconds)", sizefile, (elapsed) However, the brackets are needed to denote that the string is formatted and to be able to be split in to two lines. What would be the best way to do this? A: I think you should write your code as follow: string format = string.Format(@"{{0}} {{1} seconds}", sizefile, (elapsed)); A: string.Format takes the placeholders ({0}... {n}) as regular arguments, so you don't need to use the {...} brackets. string format = string.Format(@"{0} {1} seconds)", sizefile, (elapsed)); This is often the easiest way to avoid errors like the one you are currently getting. You'd have to use nested braces (unless you're using C# 6.0) when you call Format to explicitly allow the curly brackets to separate the arguments and format specifiers: string format = string.Format(@"{{0}} {1} seconds", sizefile, (elapsed)); A: string.Format requires that the
