How do we keep track of the cloud computing industry and the related standards, methodologies, implementation methodologies, and case studies? I guess I could get a bookmark, or even get a little book from the library, but what would be ideal is an online resource. Read our upcoming book at the Introduction to Cloud Computing for more information. Microsoft, Apple, Adobe and others like to use sleight of hand to claim that their products are the safest, most reliable and safest, etc. as if they are somehow exempt from judgment or accountability, like little children. Apple's taking an irresponsible "better safe than sorry" approach with its own iCloud backups. For the past several years, Apple's

declined to make public the information it collects from its users. This has been done to protect the privacy of its users. Unfortunately, this trust-based approach has not worked as well as Apple hoped, and the company has had to admit that it was completely wrong. According to my sources, Apple has been the target of a government data request related to a criminal investigation into a massive data theft of celebrities' iCloud accounts. Apple has been unable to get the government to disclose the data, and we know that celebrities' information have been obtained by hackers and are being sold. In addition, I'm hearing that the company has been forced to turn over the data to a prominent media conglomerate. I'm hearing that the two entities are actively trading data for the most sensitive information about the celebrities. Of course, the media company is hoping to leverage the data to increase its market share and profits. At issue here is the leak, not a data breach. Apple has not suffered a data breach in this instance and no passwords have been obtained. The thing is, Apple is not the only company being black-boxed by the government. It has been reported that Microsoft is also being black-boxed by the government in relation to a criminal investigation. The public never learns anything

This invention relates generally to oscilloscopes and more particularly to a method and circuit for controlling peak clipping of the oscilloscope. In an electronic oscilloscope the sine wave generated by an internal quartz oscillator is amplified and displayed in numerical format. Ideally, the values displayed at the top of the oscilloscope coincide with the peak amplitude of the sine wave and the displayed amplitude values are reduced in half for every half cycle. Oscilloscopes with adjustable voltage gain and automatic gain control (AGC) are known, however, some oscilloscopes do not have such features. Various types of analog-to-digital converters (ADCs) are known in the art for converting analog signals to digital signals. Such a digital signal may be transmitted to a digital signal processor or converted into an analog signal in a digital-to-analog converter. Typical peak clipping problems are encountered with conventional ADCs when the input signal is clipped near the positive or negative peak value. A source of peak clipping in conventional oscilloscopes is the 100 nF capacitor on the oscilloscope ground lead. Typically, this capacitor is used to ground the output of the quartz oscillator. If the oscillator sees a peak voltage, the phase of the oscillator can approach zero. If the phase is close to zero, the oscilloscope displays a large

peak with a peak to peak voltage of about 15V. This peak is then clipped because the capacitor is approximately 100 nF. Since the oscilloscope ground lead is generally a long wire to the oscillator ground, the charge from the oscillator to the oscill 82138339de
