The effect of intracisternal administration of tetrahydropalmatine (THP) on the cerebral and peripheral cholinergic systems was studied in normal Wistar rats. THP was shown to potentiate the central nicotinic system and reduce the state of acetylcholine-dependent toxicity after intoxication with an organophosphorous compound. It is suggested that the blockade of the cholinolytic activity of the ganglion plexus of the heart and peripheral cholinergic neurons in the cases of poisoning with phosphorylating agents may be responsible for the development of the toxic syndrome of the "silent" type.Q: Metric space as a topological space in the sense of Engelking.
